Professional Summary

Language-agnostic Software Engineer specializing in Python backend architecture, automated CI/CD pipelines, and AI-assisted development. Highly adaptable and accustomed to leveraging modern AI tooling (Cursor, Copilot, LLMs) to accelerate shipping production-quality code. Currently researching autonomous cloud governance using Generative AI for a university thesis. Seeking to apply a strong foundation in APIs (FastAPI), modern DevOps, and rapid learning to complex, high-impact digital products.

Technical Skills

Cloud & Infrastructure

AWS (EC2, S3, IAM, Lambda), GCP, Oracle Cloud, Docker, Docker Compose, Linux Administration

Programming & Databases

Python (Advanced), FastAPI, PostgreSQL, AWS DynamoDB, JavaScript/TypeScript (Working Knowledge)

DevOps & Automation

GitHub Actions (CI/CD), Terraform (IaC), Git, Bash scripting

Networking

TCP/IP fundamentals, Firewall/DPI management, Network Traffic Analysis, Cloud Networking (AWS VPC, OCI VCN), TLS/SSL Encryption, Caddy/Reverse Proxies.

Security

JWT Authentication, RBAC, Data Encryption (bcrypt), Firewall/DPI management, Basic ELK & Snort, Splunk

Tools

Excel, Powerpoint, Operating Systems, Virtual machines

Experience

08/2025 – 11/2025
Ulaanbaatar, Mongolia

Khan Bank, SOC & Security Engineer Intern

- Engineered automated manual data reporting pipelines using Python, successfully cutting processing time by 40%.
- Maintained Linux production servers and wrote custom Bash scripts for proactive monitoring and efficient log rotation.
- Collaborated closely with DevOps teams in an Agile/Jira environment, actively participating in code reviews to ensure secure deployment practices.

Projects

Stateless IAM API Architecture , Python, FastAPI, Docker, PostgreSQL, AWS EC2, GitHub Actions

- Automated Infrastructure (IaC): Provisioned highly available AWS EC2 environments and configured security groups using Terraform, embracing immutable infrastructure principles.
- CI/CD Implementation: Championed automation by engineering a GitHub Actions pipeline that automatically builds, tests, and pushes Docker images to a container registry upon code merges.
- Containerization: Packaged a Python/FastAPI application and PostgreSQL database using Docker, ensuring isolated, consistent, and easily deployable environments.
- Security & Validation: Implemented zero-touch TLS/SSL encryption via Caddy reverse proxy, alongside JWT-based authentication and Role-Based Access Control (RBAC), aligning with strict software security and regulatory principles.

- **Technical Documentation:** Authored comprehensive system documentation and designed visual system architecture diagrams to clearly communicate traffic flow and deployment processes.

3D Global Threat Map *🔗, Docker, GitHub Actions, Caddy, Node.js, Oracle Cloud*

- Architected an end-to-end containerized deployment pipeline for a high-performance 3D visualization tool, prioritizing infrastructure durability.
- Implemented automated CI/CD via GitHub Actions to build, push to a container registry, and deploy code updates to production without manual server intervention.
- Hardened network infrastructure on an Oracle Cloud VM by implementing strict firewall rules to drop unverified packets, allowing only necessary HTTP/HTTPS traffic.
- Managed automated SSL/TLS certificates via the ACME challenge using a Caddy reverse proxy positioned at the network edge.

GCP Serverless API Hub,

Telemetry & Analytics API | Google Cloud Platform | Terraform | Cloud Run | API Gateway | Docker | GitHub Actions

- Built a secure, multi-region telemetry API on GCP using infrastructure-as-code (Terraform).
- Restricted public access: private Cloud Run backend, only /analytics and /ingest exposed via API Gateway.
- Containerized with Docker, automated deployments via GitHub Actions.

Cloud Security Auditor, *AWS, Serverless, Python, Terraform*

- Developed an event-driven serverless scanner that automatically checks uploaded infrastructure configuration files for vulnerabilities.
- Eliminated the need for manual security reviews by detecting misconfigurations on upload and firing SNS alerts in under 2 seconds.
- Provisioned the full stack (S3, Lambda, SNS, IAM) entirely via Terraform with zero manual console steps.

Serverless Log Forensics, *AWS, DynamoDB, Threat Detection*

- Automated SQLi and XSS threat detection in Apache/Nginx logs utilizing a serverless Lambda pipeline and custom Python regex engines.
- Stored captured Indicators of Compromise (IOCs) structurally in DynamoDB for reliable forensic replay and queryable threat intelligence.

ELK + Snort SIEM Pipeline, *Docker, ElasticSearch, Kibana*

- Built a lightweight, working IDS-to-dashboard pipeline integrating Snort IDS with the ELK stack to detect and visualize network threats in real time.
- Fully containerized the deployment with Docker to simulate the monitoring stack used in real-world security operations and ensure portability.

Education & Credentials

2022 – 2026 Warsaw	B.S. Engineering - Computer Science (Cybersecurity), <i>University of Economics and Human Sciences (Vizja)</i> Diploma Thesis Topic - Autonomous Cloud Governance: Leveraging Generative AI for Self-Healing AWS CIS Benchmark Compliance
-----------------------	---

Certifications:

- | | |
|---|---|
| • AWS Solutions Architect - Associate (In Progress) | • Cisco NetAcad - Networking Basics (Completed) |
